

SSH TeraTerm Session Manager — Quick User Guide

What This Program Does

This tool helps you store SSH connection settings (name, IP address, port, username, password) and quickly open them in **TeraTerm** with one click.

It also keeps automatic backups of your session list.

1. Starting the Program

Just launch **SSH TeraTerm Session Manager**.

The main window shows:

- A list of all saved sessions
 - Fields where you can enter or edit the session details
 - Buttons for **Save**, **Connect**, **Ping**, **Help**, and **Sessions Folder**
-

2. Adding a New Session

1. Type a **Session Name** in the *TITLE* field.
2. Enter the **IP address**.
3. Enter the **Port** (default SSH port is **22**).
4. Enter your **Username** (optional, only needed for auto-login).
5. Enter your **Password** (optional, only needed for auto-login).
6. Make sure “**User/Pswd OK**” is checked if you want to save username & password.
7. Click **SAVE**.

Your new session appears in the list on the left.

3. Editing an Existing Session

1. Click any saved session in the list.
 2. Its details fill the fields automatically.
 3. Make changes if needed.
 4. Click **SAVE** again.
-

4. Connecting to a Session

1. Click a session in the list.
2. Press **ENTER** or click **CONNECT**.

If you saved a username and password, the program will log in automatically.

5. Showing or Hiding Your Password

- Check or uncheck **Show Password** to toggle visibility.

Both the **User** and **Password** fields follow this setting.

6. Testing if a Server Is Reachable

- Click **PING** after entering an IP address.
 - You will get either a “Ping Is Good” or “Ping Is Bad” message.
-

7. Where Your Sessions Are Saved

Your session list is stored in:

C:\Users\<YourUserName>\AppData\Roaming\teraterm5\
